Commentary for screenshots provided (chandraas)
1.jpg
The last command sent on the left window shows the server being run. The right window shows the client. I use an out-of-bounds year a few times to test the randomness, and then I use a year within range.

2.jpg
Left is the ec2 instance running the server. Right is the client running on my machine.

3.jpg
Showing the crontab configuration on the instance.

4.jpg
Left is instance running the server, right is my local client. Server runs without needing to run java MusicGuruServer. Further proof with ps -auxww | grep java on the server.

5.jpg
New instance created from image. Public IP of the instance is now 3.80.233.179, compared to 54.82.65.232 in previous screenshots. Again, left is the instance running the server, right is my local client.

6.jpg
Showing the original instance and the instance created from an image, labelled as "NWEN proj 2" and "NWEN proj 2 image instance" (along with some other instances for project 1 and for other courses).

7.jpg
The image I created from the original instance.
